* Flux 4%, 49MPa(500kg/cm2), sample sintered at 1600 degC.

AM-21 / AM-210 : Ground high calcined alumina. Used for intermediate buffing stages of stainless steel.

AM-210-02 : A variation of AM-210 with bigger particle size and bi-modal particle size distribution. Used for both initial and intermediate buffing stages of stainless steel.

AM-27 : Finely ground for mirror surface buffing stages of stainless steel.

AM-28B : Specially developed for intermediate buffing stages of stainless steel. Some of coarse particles crumble to fine particles.

AES-11/11C : Sub-micron size particles. Used for fine ceramic applications requiring 99% purity or higher.

AES-11H : Contains less re-agglomeration than AES-11 / 11C, and it makes slurry dispersion easier.

AES-12 : MgO not added. Also used as a sub-filler of thermal interface materials.

AES-23 : Thixotropic and low viscosity.

Easy to be adsorped ↑	organic acid	PO_4^{-3}	F^-
	water		
	alcohol	F^-	
	amine		
	mercaptan	$[Fe(CN)_6]^{-4}$	
	aldehyde		Cl^-
	ketone	SO_4^{-2}	
	ester		
	ether	$[FE(CN)_6]^{-3}$	
	aromatic hydrocarbon	$Cr_2O_7^{-2}$	Br^-
Difficult to be adsorped ↓	sulfide		
	organic halogen	Cl^-	
	unsaturated hydrocarbon	MnO_4^-	
	saturated hydrocarbon	ClO_4^-	I^-

Activated Alumina can be used as an adsorption refining agent, especially to refine non-polar solvents.

In general, the more polarity and heavier molecular weight, the better adsorption effect would be obtained.

Adsorption order example as follows.
-SO3H > -COOH > -OH, -NH2, -SH > -CHO
> -CO > -COOR > -S-, -O- > -X
> Unsaturated hydrocarbons
> Saturated hydrocarbons

Adsorption performance can be measured in terms of adsorption rate and transmission rate of the picric acid by sending a benzene solution of picric acid through a column filled with activated alumina.

An alumina powder with a large surface area and some crystal water.

Used as a binder for refractories instead of alumina cement due to large caking capacity and plasticity.

Condition/setting time of the hydraulic alumina and water mixture

Water Volume (g/100g-Al2O3)	Kneaded material condition	Setting Time* (min.)
60	Dry	-
70	Impossible to knead	-
75	Creamy	-
80	Creamy	15
90	Slurry with good fluidity	20

* Setting time is determined by JIS R 5210 needle penetration method (slurry thickness 38mm). Distance between the slurry bottom and the needle is 25mm.
